1. Background

a. Problem Definition and Impact

Problem Domain

For many job seekers, applying for jobs has required full-time effort as they go through the repetitive process of completing long application forms across multiple job searching platforms and individual company websites. The majority of these applications require re-entering the same personal details and employment history which can lead to job seekers wasting substantial time and feeling demotivated.

Why it is a problem

The current job market is proving to be highly competitive. In 2025, 58% of people worldwide said they are seeking for a new job, however, they found that most applications do not receive any response back (LinkedIn, 2025). Moreover, 60% of job seekers become frustrated and abandon applications are too long or complicated as most prefer simplicity and efficiency when applying (Gentle, 2024). Applications requiring only five to seven minutes to complete have a higher completion rate of 80%, while, applications requiring more than 10 minutes has shown lower completion rates (Mifflin, 2025).

The repetitive nature of completing multiple job applications can lead to a waste of valuable time while also demotivating job seekers. Employers may also miss out on talented candidates who opened the application, but did not complete it due to the excessive length of the application (Fritz, 2025). Therefore, to avoid losing talent Artificial Intelligence (AI) can simplify this process while also providing personalisation through one-click applications.

Overview of Proposed solution

Our solution, AI Apply, aims to streamline the repetitive job application process through full automation while providing job seekers with a tailored resume and cover letter based on their current employment history and specific job requirements.

AI Apply will deliver a seamless one-click job application experience through a Chrome extension that can automatically fill forms, upload personalised resumes & cover letters, and intelligently answer screening questions across major platforms such as Seek, LinkedIn, Indeed and Naukri. The Chrome extension will be fully integrated with JobGen.AI API to handle generating tailored resumes & cover letters for each application. Additionally, our solution will maintain comprehensive application tracking, allowing job seekers to monitor their job search effectively.

AI Apply will be adaptable to all kinds of applications, gracefully handling dynamic form variations and unexpected fields to ensure consistent and high quality application completion.

Ultimately, our solution reduces the typical 30 minute manual application process (Pacelli, 2025) to just 2 minutes of automated workflow, motivating job seekers to apply to more positions with competitive and professional applications.

b. Review of Existing Systems

As JobGen.AI is a chrome extension, we looked at the top two extensions in the chrome web store that has similar capabilities: Simplify Copilot and Careerflow.

Simplify Copilot

Overview

Simplify Copilot is one of the most used AI job application assistants on the chrome webstore with over 400,000 users. It allows for automating form filling, tailoring resumes, and tracking applications across various platforms.

Problem being solved

Applying for jobs can sometimes be a whole job in itself with how tedious it can get by repeatedly entering the same information across multiple job applications. Simplify Copilot addresses this by doing the bulk of the application for you, extremely efficiently.

Strengths

- Auto filling applications: Automated form filling of basic information (name, date of birth, phone number, etc)
- Saves submitted applications to a dashboard, eliminating the need to constantly move between job sites to track applications.
- Ease of use: Users have praised the intuitiveness of Simplify's design, making the application process more manageable.

Limitations

- Limited platform support: Simplify currently gets its job postings from companies that have to opt-in to their platform, leaving out the major job sites such as LinkedIn, Indeed, or Seek. Furthermore, their platform is primarily focused on jobs in US, UK, and Canada.
- Users have reported that the resume generation is not the best, as it will add experiences that the user has not had.
- While the autofill feature is decent for basic cases, Simplify Copilot tends to leave the more complex questions blank.

Careerflow

Overview

Careerflow is an AI powered platform aimed at assisting people in optimising their LinkedIn profiles, track job applications, and generated tailored cover letters. It currently has around 200,000 users on the chrome web store.

Problem being solved

According to Product and London Design, 97% of HR and staffing professionals include LinkedIn for recruiting, and yet many profiles are bland and uninteresting, which reduces the chances of it being looked at by a recruiter. That is the problem that Careerflow aims to solve, while also offering a platform to track all your current job applications and AI generated tailored resumes.

Strengths

- Uses a scoring system from 0-100 to grade profiles based on best practices. Uses AI to rewrite your profile while also having tips and guides for each section.
- Tailored cover letters using AI and an auto import job description feature to generate a cover letter unique to the job description.
- Comprehensive job application tracking in a centralized dashboard that can monitor application statuses, organise contacts and set reminders.

Limitations

- A lot of Careerflow's functionality is tied down to LinkedIn, like their cover letter generator can only import descriptions from LinkedIn or even their job search tool in their website can only search for jobs posted in LinkedIn.
- Unlike Simplify, Careerflow does not offer extensive auto-fill functionalities.

Implications for JobGen.AI

- Unlike Simplify and Careerflow, JobGen can aim to support a broad range of platforms that can be easily auto-filled.
- It is important that JobGen matches or improves on Simplify's ease of use as an unintuitive app is one of the quickest ways for users to lose interest.
- Both platforms tend to fall short in their auto-fill capabilities. JobGen's autofill should be accurate and not be a generic copy-paste answer in all applications. It should be tailored to the job, using keywords from the job description where appropriate.

2. User Stories and Sprints

a. Scope Statement

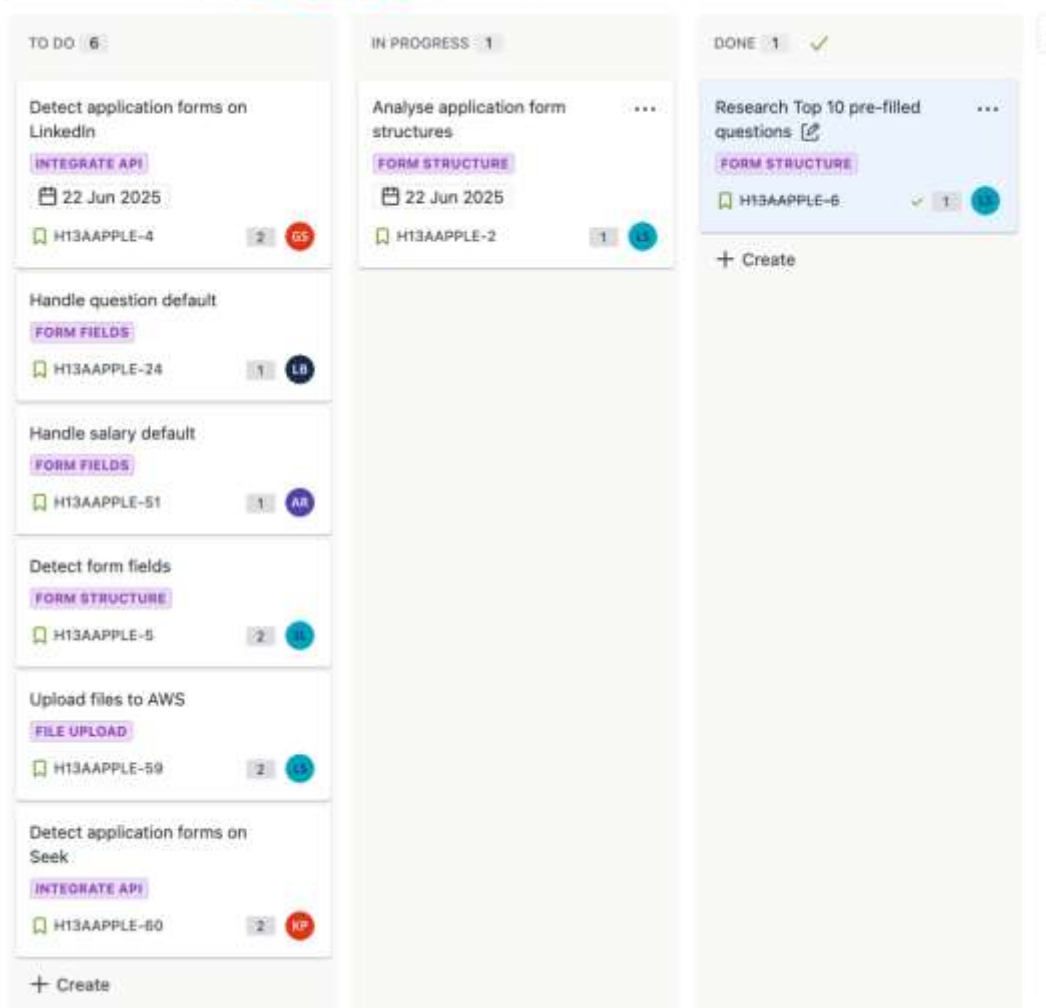

Our team will deliver a Chrome Extension that enables a seamless one-click job application experience across Seek, LinkedIn, Indeed, Naukri, and Glassdoor. The product will integrate with the JobGen.AI API to pre-fill job application forms, upload tailored resumes and cover letters, handle complex fields and psychometric questions, and allow users to preview and log each submission.

Out of scope: Backend modifications to third-party platforms and use beyond defined API integrations.

Approved: 6/12/2025 via Email.

b. Sprint 1 User Stories

Our backlog consists of user stories allocated to Sprint 1, containing the summary and description, and acceptance criteria.

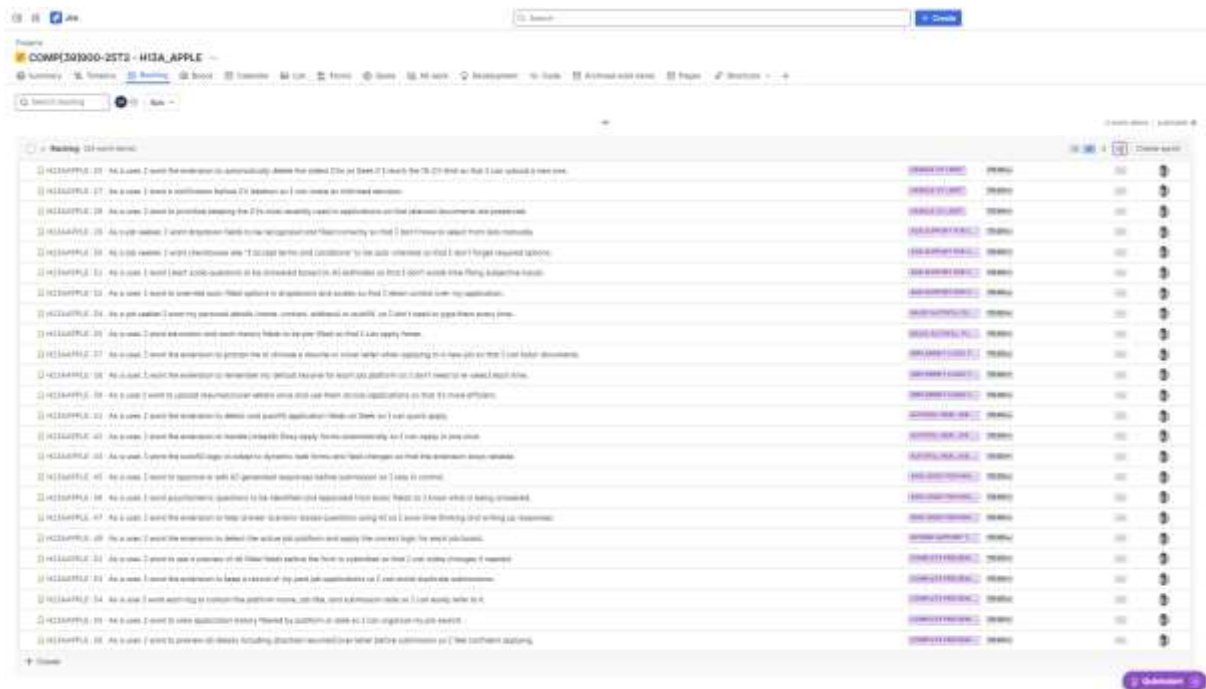

Summary	Description	Acceptance Criteria (AC)
H13AAPPLE-2 - Analyse application form structures	As a developer, I want to analyse application form structures in LinkedIn, Indeed, Naukri.com , Glassdoor, Seek	- Form structures on platforms are documented - Common input types and naming patterns are identified - Stored in an internal knowledge base
H13AAPPLE-4 - Detect application forms on LinkedIn	As a developer, I want to detect job application forms by integrating the API on LinkedIn.	- Detects forms and identifies field types - Works on LinkedIn - Logs detection results for debugging
H13AAPPLE-5 - Develop form fields	As a developer, I want to build a system for form fields so that we can auto fill them	- Standard rules for text, radio, dropdown, checklist - Handle edge cases (e.g. salary vs expected salary) - Review with at least 1 other developer
H13AAPPLE-6 - Research Top 10 pre-filled questions	As a developer, I want to research the 10 most common job application questions so we can pre-fill answers for users	- Compile list with examples from LinkedIn, Indeed, Naukri.com, Glassdoor, Seek - Include variations (e.g "Expected Salary" could be "Desired Pay") - Shared with JobGen.AI API team
H13AAPPLE-24 - Handle question default	As a developer, I want the system to detect experience-related questions (e.g., "Do you have PM experience?") so that we can provide default responses when the http://JobGen.AI API doesn't return values.	- Experience questions (e.g., PM experience, leadership experience) are detected using classification or keywords. - If http://JobGen.AI API does not provide an answer, a default response is provided (e.g., "Yes, I have experience in project management...").
H13AAPPLE-51 – Handle salary default	As a developer, I want the expected salary to default to AUD 120,000/year if the http://JobGen.AI API does not supply one so that the	- Expected salary field is identified in the form. http://JobGen.AI API provides a salary, else default to AUD 120,000/year.

	salary field is always populated accurately.	Value is formatted correctly based on the platform's required input style (e.g., plain number, currency format).
H13AAPPLE-59 - Upload files to AWS	As a developer, I want to upload files to a cloud storage service like AWS S3, so that I can get a direct download link for each file.	- Files can be uploaded to a cloud service (e.g., AWS S3). - A public URL is generated for each uploaded file. - The URL allows direct file download. - Upload process is secure and handles common file types. - Upload errors are logged and reported to the user.
H13AAPPLE-60 - Detect application forms on Seek	As a developer, I want to detect job application forms by integrating the API on Seek.	- Detects forms and identifies field types - Works on Seek - Logs detection results for debugging

c. Product Backlog

Our product backlog consists of user stories grouped into functionalities (epics) which will later be allocated to Sprints 2 and 3. These are listed below:

Key functionality:	User Stories:	Acceptance criteria:
Add support for complex form fields (dropdowns, checkboxes, Likert scales)	- As a job seeker, I want dropdown fields to be recognized and filled correctly so that I don't have to select from lists manually https://unsw-cs3900-cs9900-25t2.atlassian.net/browse/H13AAPPLE-29 - As a job seeker, I want checkboxes like "I accept terms and conditions" to be auto-checked so that I don't forget required options. https://unsw-cs3900-cs9900-25t2.atlassian.net/browse/H13AAPPLE-30 - As a user, I want Likert scale questions to be answered based on AI estimates so that I don't waste time filling subjective inputs. https://unsw-cs3900-cs9900-25t2.atlassian.net/browse/H13AAPPLE-31 - As a user, I want to override auto-filled options in	• Dropdown fields are automatically detected. • Default or user-defined choices are selected. • The selected value is consistent with the field label. • Checkboxes with common patterns (e.g., agreements, consents) are auto-checked. • Checkbox state can be toggled by the user. • The extension can detect Likert scale question formats (e.g., 1–5 or Strongly Disagree to Strongly Agree). • A tooltip or brief explanation is available showing

	dropdowns and scales so that I retain control over my application. https://unsw-cs3900-cs9900-25t2.atlassian.net/browse/H13AAPPLE-32	why a certain AI response was selected (e.g., “Based on your leadership experience, we selected 4 - Agree”). • If multiple Likert questions of a similar type appear (e.g., multiple questions on adaptability), the AI provides consistent responses. • All filled values are editable before submission. • An "edit" button or toggle is present in the preview modal.
Basic autofill function of extension	- As a job seeker I want my personal details (name, contact, address) to autofill, so I don't need to type them every time. https://unsw-cs3900-cs9900-25t2.atlassian.net/browse/H13AAPPLE-34 - As a user, I want education and work history fields to be pre-filled so that I can apply faster. https://unsw-cs3900-cs9900-25t2.atlassian.net/browse/H13AAPPLE-35	• Fields like name, email, phone, and address are filled from saved user profile. • Data is inserted within 2 seconds of page load. • Fields for school, degree, job title, and employer are filled accurately. • Autofill respects chronological order of entries.
Implement logic for uploading resumes and cover letters (user-	- As a user, I want the extension to prompt me to choose a resume or cover letter when applying to a new job so that I can tailor documents. https://unsw-cs3900-cs9900-25t2.atlassian.net/browse/H13AAPPLE-37	• A file picker is triggered when the job application form is detected. • Selected files are shown in the preview.

assisted if needed)	- As a user, I want the extension to remember my default resume for each job platform so I don't need to re-select each time. https://unsw-cs3900-cs9900-25t2.atlassian.net/browse/H13AAPPLE-38 - As a user I want to upload resumes/cover letters once and use them across applications so that it's more efficient. https://unsw-cs3900-cs9900-25t2.atlassian.net/browse/H13AAPPLE-39	• Defaults can be saved per platform. • Default files auto-load unless overridden. • Files are stored locally or in synced storage. • Stored documents are accessible via dropdown.
Have function to delete CV if more than 10 on seek.	- As a user, I want the extension to automatically delete the oldest CVs on Seek if I reach the 10-CV limit so that I can upload a new one. https://unsw-cs3900-cs9900-25t2.atlassian.net/browse/H13AAPPLE-25 - As a user, I want a notification before CV deletion so I can make an informed decision. https://unsw-cs3900-cs9900-25t2.atlassian.net/browse/H13AAPPLE-27 - As a user, I want to prioritize keeping the CVs most recently used in applications so that relevant documents are preserved. https://unsw-cs3900-cs9900-25t2.atlassian.net/browse/H13AAPPLE-28	• Oldest files are deleted automatically if limit is reached. • User is notified of the deletion. • Notification appears when CV count exceeds limit. • Deletion only proceeds after user confirms. • Usage metadata is tracked per CV. • Sorting and priority logic is applied before deletion.
Autofill real job site forms (e.g., Seek, LinkedIn)	- As a user, I want the extension to detect and autofill application fields on Seek so I can quick apply. https://unsw-cs3900-cs9900-25t2.atlassian.net/browse/H13AAPPLE-41 - As a user, I want the extension to handle LinkedIn Easy apply forms automatically so I can apply in one click. https://unsw-cs3900-cs9900-25t2.atlassian.net/browse/H13AAPPLE-42	• Form fields on Seek are recognized and filled. • Matching is consistent with saved user profile. • LinkedIn Easy Apply forms are supported.

	cs3900-cs9900-25t2.atlassian.net/browse/H13APPLE-42 - As a user, I want the autofill logic to adapt to dynamic web forms and field changes so that the extension stays reliable. https://unsw-cs3900-cs9900-25t2.atlassian.net/browse/H13APPLE-43	• Data is inserted correctly in each input. • Form validators pass without user intervention. • Input types and formats match site expectations.
Add logic for handling psychometric-type questions using AI	- As a user, I want to approve or edit AI-generated responses before submission so I stay in control. https://unsw-cs3900-cs9900-25t2.atlassian.net/browse/H13APPLE-45 - As a user, I want psychometric questions to be identified and separated from basic fields so I know what is being answered. https://unsw-cs3900-cs9900-25t2.atlassian.net/browse/H13APPLE-46 - As a user, I want the extension to help answer scenario-based questions using AI so I save time thinking and writing up responses. https://unsw-cs3900-cs9900-25t2.atlassian.net/browse/H13APPLE-47	• Psychometric-style questions (personality, logic) are tagged by AI. • Tagging is 90% accurate in tests. • AI answers are shown in a confirmation step. • All suggestions are editable. • Suggested answers reflect positive but honest traits. • Users can choose or modify suggested answers.
Extend support to multiple job platforms (e.g., Indeed, Glassdoor)	- As a user, I want the extension to detect the active job platform and apply the correct logic for each job board. https://unsw-cs3900-cs9900-25t2.atlassian.net/browse/H13APPLE-49	• Autofill accuracy exceeds 90%. • UI and behaviour patterns match across job sites. • Platform-specific errors are handled gracefully.
Complete preview/loggi	- As a user, I want the extension to keep a record of my past job applications so I can avoid duplicate submissions. https://unsw-cs3900-cs9900-25t2.atlassian.net/browse/H13APPLE-49	• Files are downloadable/viewable before submission.

ng functionality	25t2.atlassian.net/browse/H13AAPPLE-53 - As a user I want each log to contain the platform name, job title, and submission date so I can easily refer to it. https://unsw-cs3900-cs9900-25t2.atlassian.net/browse/H13AAPPLE-54 - As a user, I want to view application history filtered by platform or date so I can organize my job search. https://unsw-cs3900-cs9900-25t2.atlassian.net/browse/H13AAPPLE-55 - As a user, I want to preview all details including attached resume/Cover letter before submission so I feel confident applying. https://unsw-cs3900-cs9900-25t2.atlassian.net/browse/H13AAPPLE-56	• Notification confirms attached documents were successfully uploaded. • Each job application is logged upon submission. • Logs persist across sessions and are stored locally or in synced storage. • Duplicate job titles on the same platform trigger a user warning. • Option to manually delete or archive past entries. • A preview modal is displayed before final submission. • All form fields (text, dropdowns, checkboxes, etc.) are shown in the modal. • Each field is editable from within the preview. • "Edit" and "Confirm Submission" buttons are present and functional.
---------------------	---	---

d. Sprint Timeline and Milestones

Sprint 1

Due: Week 5 Lab (3 July)

User Stories: 13

Objectives:

- Integrate with JobGen.AI API and test with dummy data
- Research & define Top 10 Pre-Filled Questions + Share with JobGen.AI
- Implement basic Chrome Extension skeleton
- Implement file upload function
- Detect and autofill fields in a mock job form
- Create Figma diagrams for extension workflow and UI

Deliverables:

- Technical Design (due in proposal week 3 sat)
- Demo video file upload function (due Sunday of Week 5)
- Basic extension demo (mock form autofill)

Sprint 2

Due: Week 8 Lab (24 July)

User Stories: 15

Objectives:

- Integrate feedback from client meeting
- Add support for complex form fields (dropdowns, checkboxes, Likert scales)
- Implement logic for uploading resumes and cover letters (user-assisted if needed)
- basic autofill function of extension
- Autofill real job site forms (e.g., Seek, LinkedIn)
- Begin logging and preview features
- Have function to delete CV if more than 10 on seek.
- Have user Error handling handled.

Deliverables:

- Resume and cover letter upload (or guided file input)
- Basic error handling in place
- Demo video on at least one real job platform with file upload functions (due Sunday of Week 8)

Sprint 3

Due: Week 10 Lab (6 August)

User Stories: 12

Objectives:

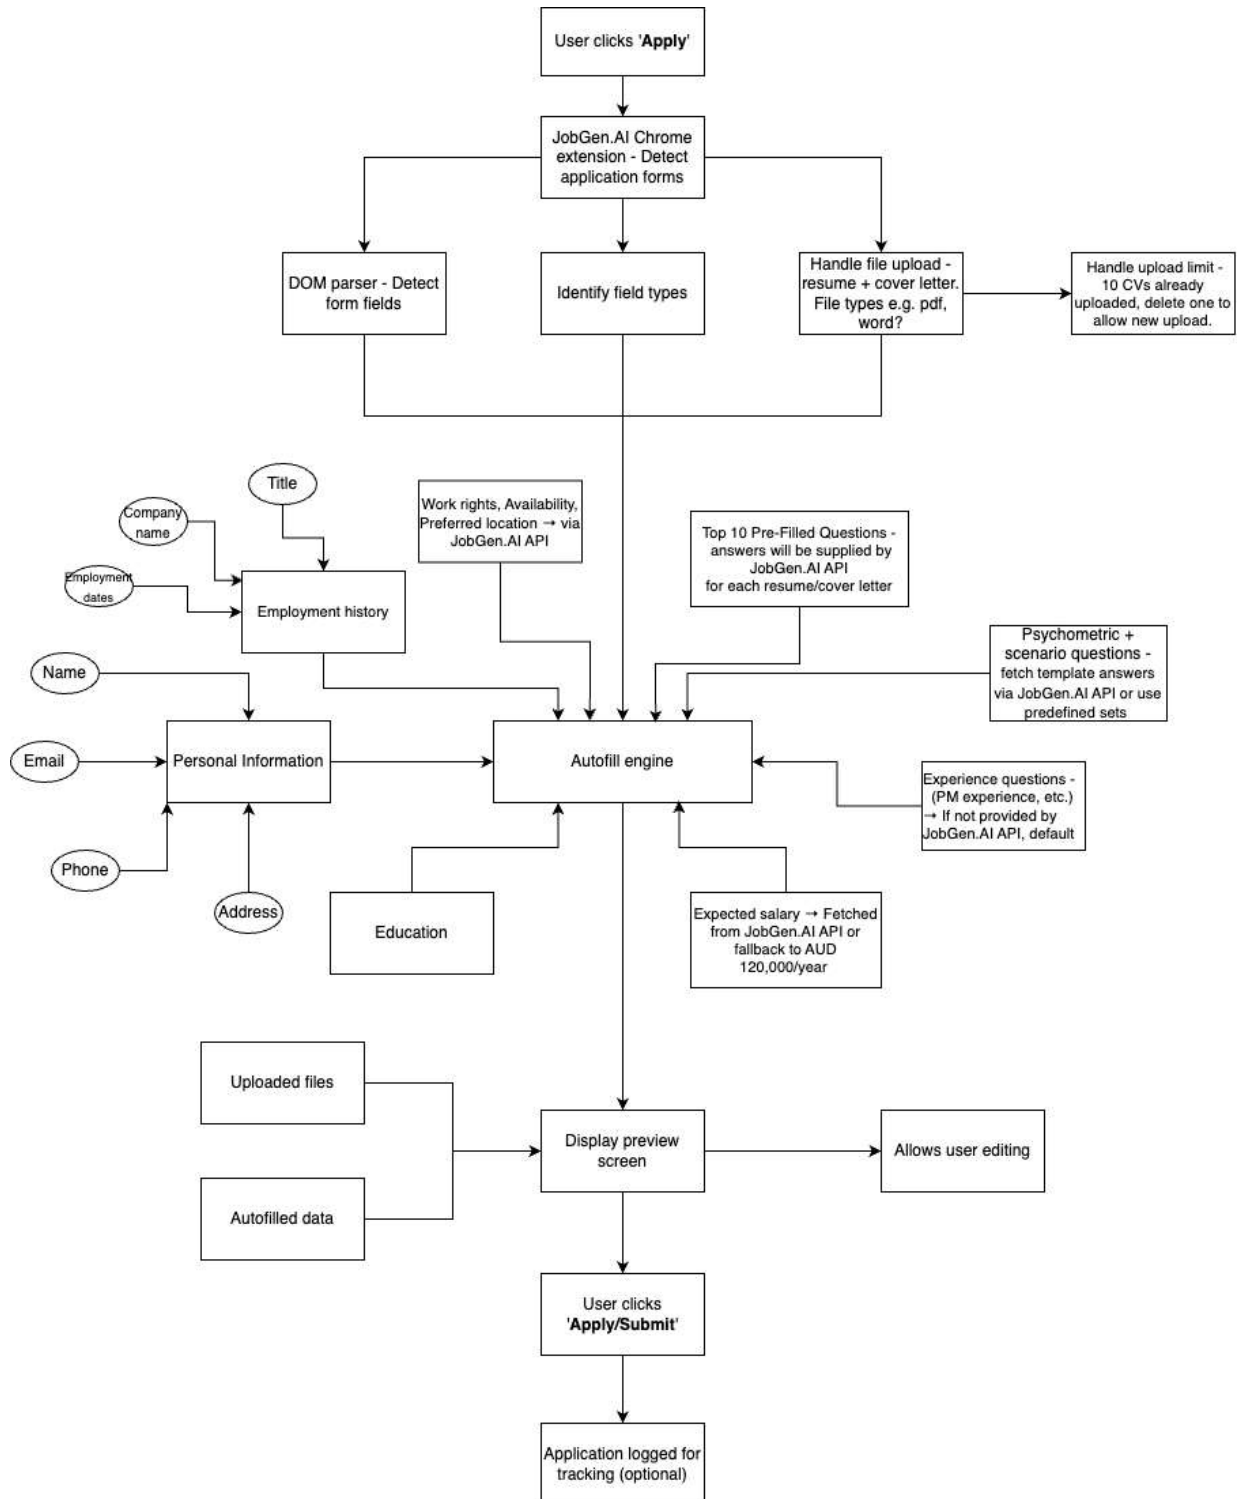

- Final polish on extension UI/UX
- fallback logic for scenarios where resume retrieval fails
- Extend support to multiple job platforms (e.g., Indeed, Glassdoor)
- Add logic for handling psychometric-type questions using second backend call.
- Finalise documentation, video, and report

Deliverables:

- Final demo video (due Sunday week 10)
- Project report (due Sunday of Week 10)
- Final bug fixes and client-requested changes

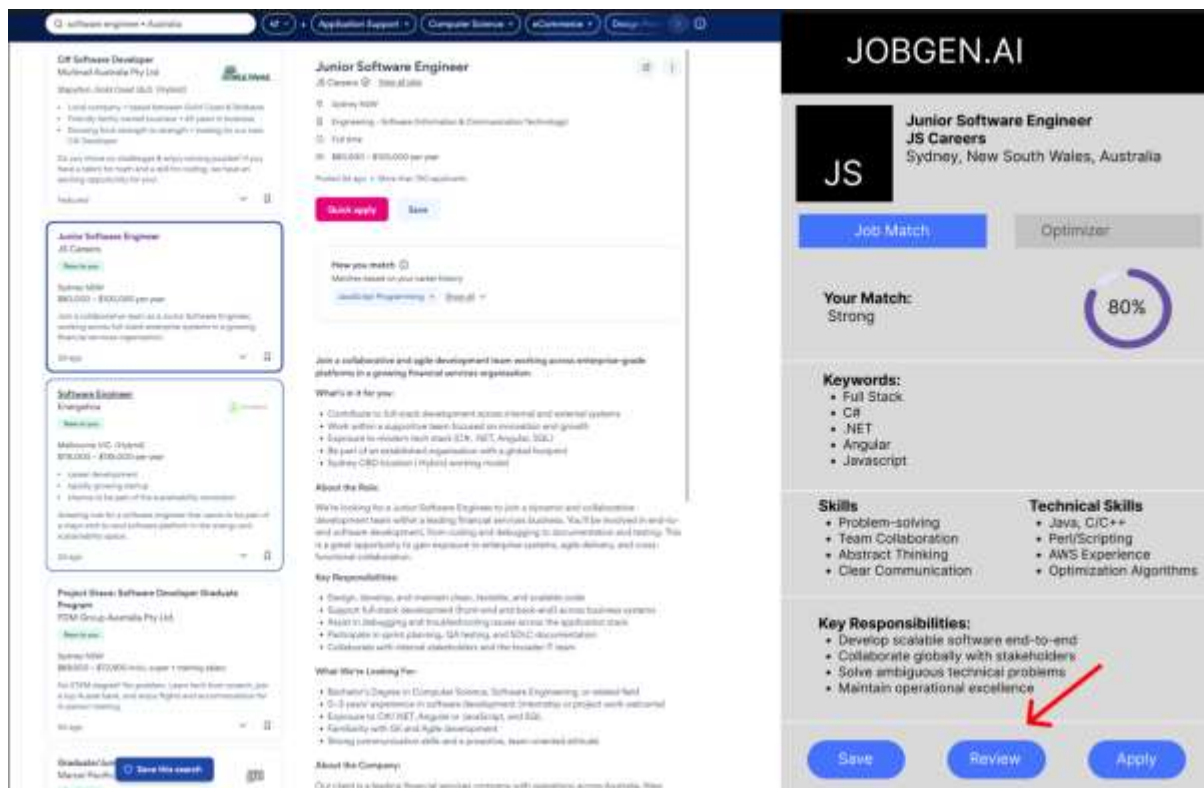

3. Technical Design

a. System Architecture Diagram

b. Interface Storyboarding

Review Button

- User lands on job posting, chrome extension opens to the right
- User clicks on Review button
- Triggers a call to job_apply API

Job Match

Optimizer

Auto-filling fields

- AI Apply will automatically fill out basic fields
- Backend will return tailored resume, cover letter and top 10 application Q&A.
- Form Detection and DOM field mapping handled dynamically

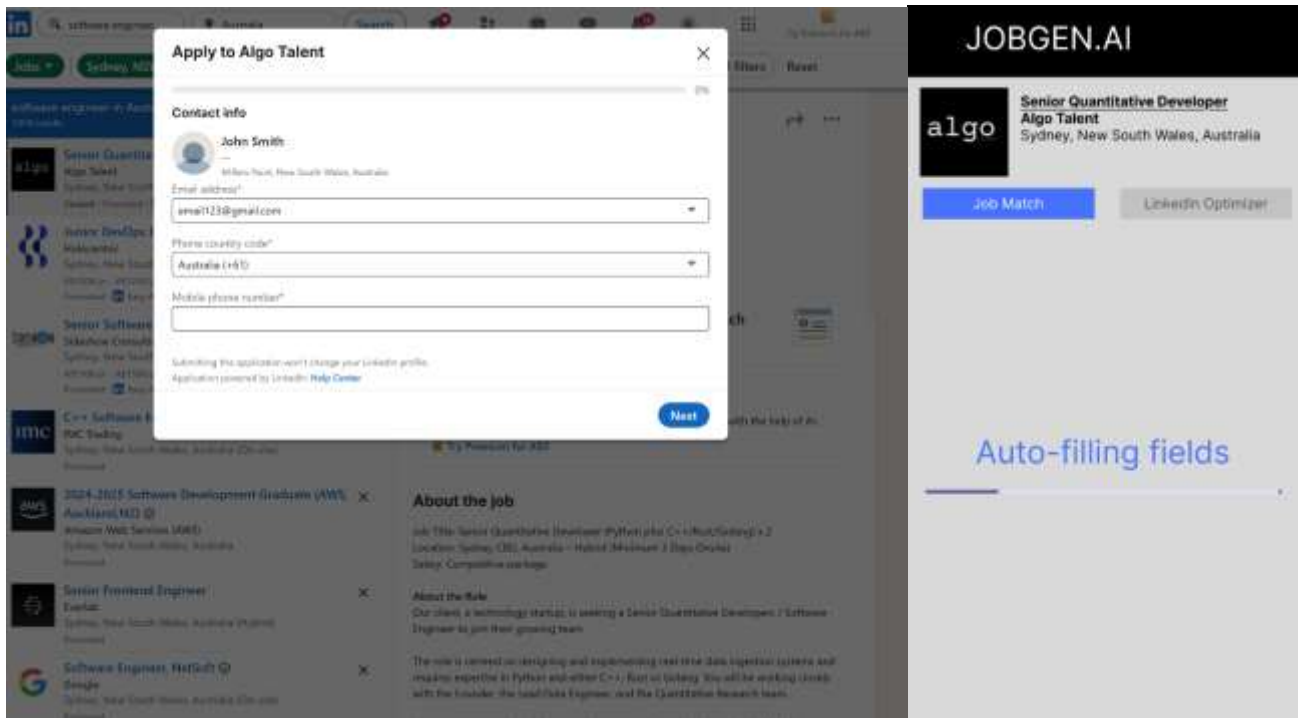

- Form is not submitted, instead a preview screen of the details AI filled in, along with the tailored resume and cover letter pops up.
- User can verify any details and manually submit the application

Apply Button

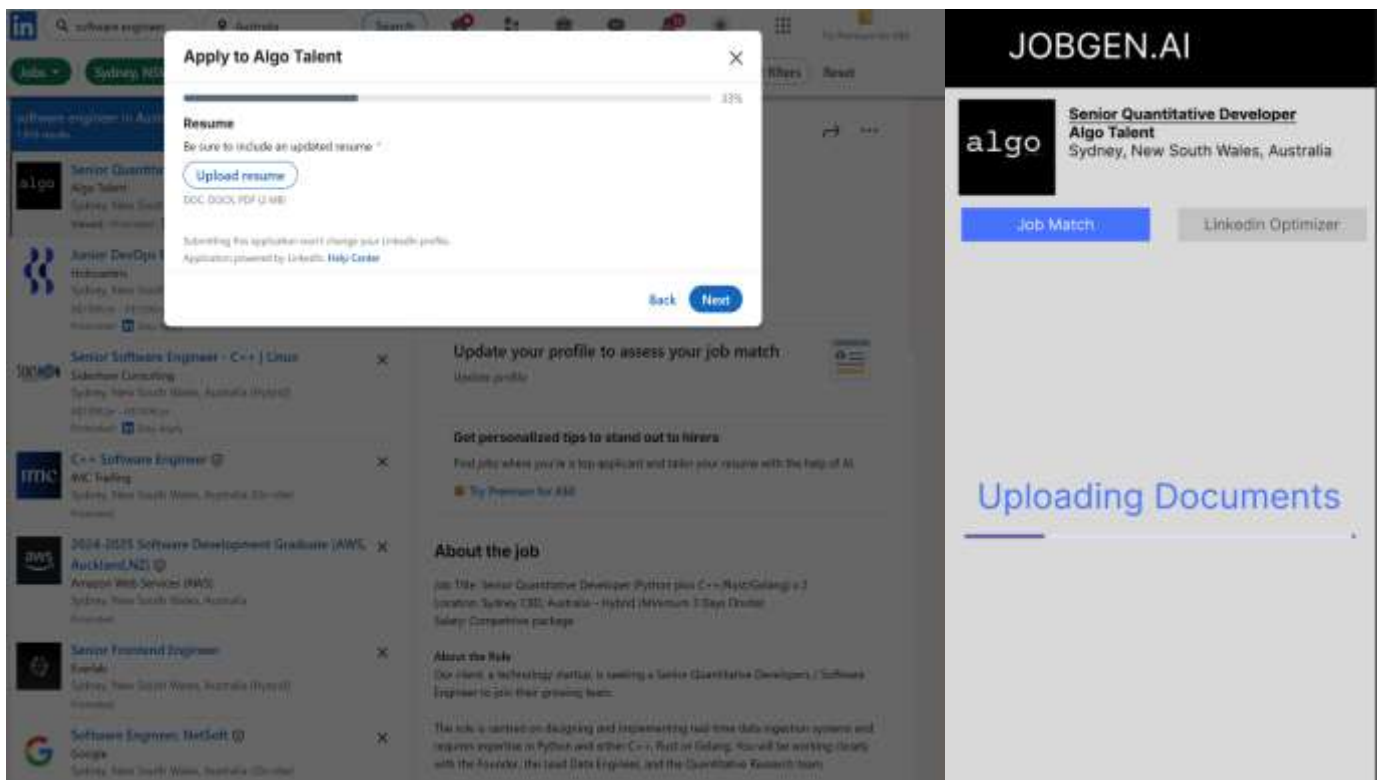

- User lands on job listing, JobGen.AI opens to the right.

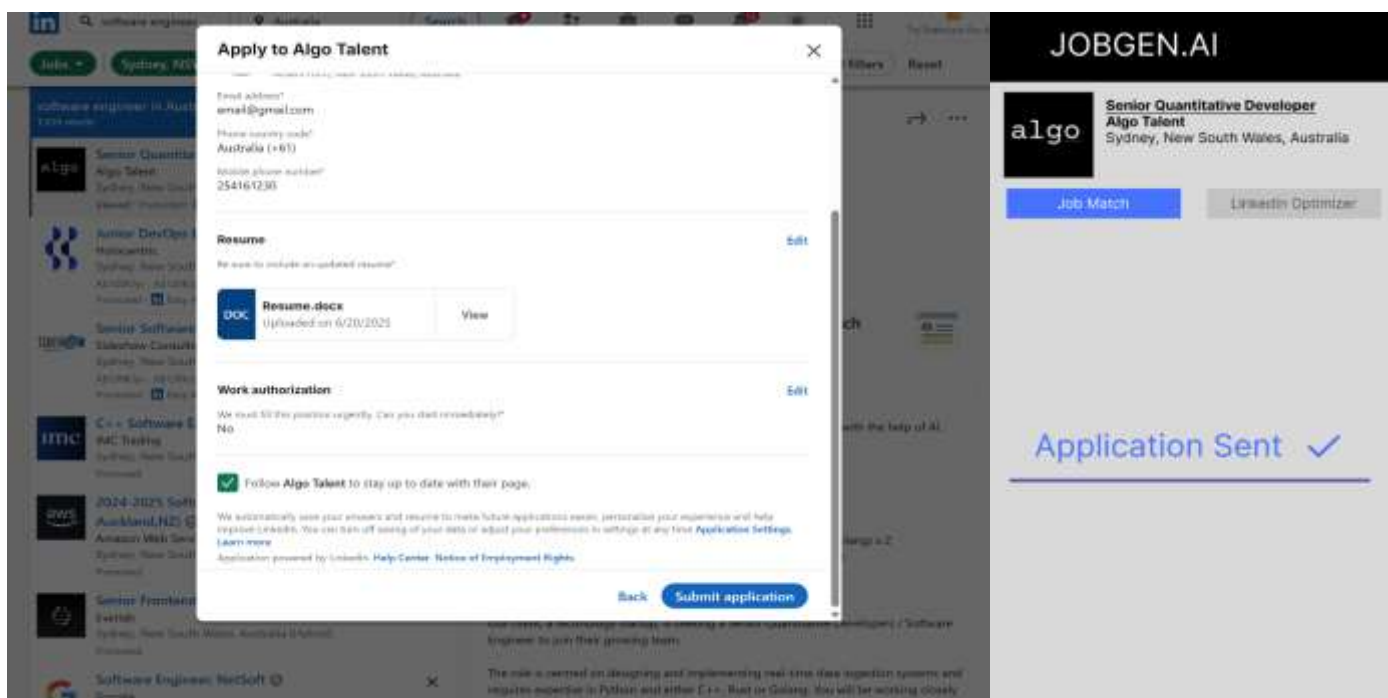

- For a one-click application, user clicks on the Apply button within the extension
- This triggers a call to the job_apply API.

- JobGen.AI automatically fills out basic fields from user information received on registration
- Backend returns tailored resume, cover letter, and top 10 application question answers.
- Form detection and DOM field mapping handled dynamically.

- Resume and cover letter are uploaded automatically.
- Since apply button was clicked, no review before submission

- Form is submitted automatically.
- Application only required a single click.

c. Design Justifications

Solutions and Design justifications:

1. Resume and cover upload

Problem:

Many job sites and listing require resume upload. However, chrome browser security does not allow extensions to insert files.

Solution

- Use the job_apply API to retrieve the resume and cover letter as downloadable files.
- Use a program to trigger the file picker
- Use a prompt to select file.

2. Psychometric and Open-ended Questions

Problem:

Many job listings require an open-ended or psychometric fields.

Solution:

- Use job_apply_faq for common answers
- Use job_apply_question for uncommon questions

Justification:

By using two different Apis we can increase flexibility and accuracy in answering questions without sacrificing speed.

3. Preview buttons and apply buttons

Problem:

Some users may prefer full automation while others may prefer a function to preview the application before submission.

Solution:

- To accommodate for both types of users we will implement both functions.
- Preview button will pause before submission. User will review before user submission.
- Apply button will automatically fill and submit.

Justification

Allows user more control over what type of submission they want.

d. Functionality Mapping

Functionality	User Story	Justification
Analyse application form structures	As a developer, I want to analyse application form structures in LinkedIn, Indeed, Naukri.com , Glassdoor, Seek	Analysing form structure across platforms is essential for accurately capturing and displaying input fields in a preview modal. If field structures are different across platforms, this allows the system to adapt and process the data regardless, ensuring consistent and current display in the user interface.
Detect application forms	As a developer, I want to detect job application forms via DOM parsing	Before a user can preview or log a submission, the extension must accurately detect the application form. DOM parsing allows the extension to identify where forms begin and end, when to trigger the preview modal, and when to log application details such as platform, job title, and timestamps. It is the core enabler of the user experience.
Detect form fields	As a developer, I want to build a system for form fields so that we can auto fill them	A system that supports standardized autofill must also allow for reliable previewing of filled fields. By developing structured form field management, the application ensures accurate and consistent field population, making it easier to render those values in the preview and log interfaces. This directly supports user confidence and control over applications.
Research Top 10 pre-filled questions	As a developer, I want to research the 10 most common job application questions so we can pre-fill answers for users	Understanding and pre-filling the most common questions enhances the completeness and usefulness of the preview for users. Users are more likely to want to verify or edit AI-generated answers to subjective or frequently asked questions. It also improves the value of the application log by capturing

		which standard questions were answered and how.
Handle question default	As a developer, I want the system to detect experience-related questions (e.g., "Do you have PM experience?") so that we can provide default responses when the http://JobGen.AI API doesn't return values.	Ensures that application forms remain complete even when external APIs fail. It maintains usability and application flow by falling back to consistent defaults for common yes/no or experience-related queries.
Handle salary default	As a developer, I want the expected salary to default to AUD 120,000/year if the JobGen.AI API does not supply one so that the salary field is always populated accurately.	This protects against blank submissions for critical fields. By inserting a realistic and pre-agreed default, we ensure compliance with platform validation rules and maintain professional presentation.
Autofill real job site forms (e.g., Seek, LinkedIn)	As a user, I want the extension to detect and autofill application fields on Seek so I can quick apply.	Automating Seek form population reduces time-to-apply and supports bulk job applications.
	As a user, I want the extension to handle LinkedIn Easy apply forms automatically so I can apply in one click.	LinkedIn's Easy Apply is designed for speed; automating this process matches platform expectations.
	As a user, I want the autofill logic to adapt to dynamic web forms and field changes so that the extension stays reliable.	Web platforms frequently update their structure. Adaptive logic ensures the extension remains functional over time.
Add logic for handling psychometric-type questions using AI	As a user, I want to approve or edit AI-generated responses before submission so I stay in control.	User review prevents inappropriate AI responses and increases trust.
	As a user, I want psychometric questions to be identified and separated from basic fields so I know what is being answered.	Distinguishing question types helps the user understand and manage how the extension handles them.
	As a user, I want the extension to help answer scenario-based questions using AI so I save time thinking and writing up responses.	AI-assisted responses reduce cognitive load and speed up application completion.

Extend support to multiple job platforms (e.g., Indeed, Glassdoor)	As a user, I want the extension to detect the active job platform and apply the correct logic for each job board.	This functionality is about scalability. The user story emphasises platform detection (e.g. LinkedIn or Indeed) and adaptive logic for form structure and behaviour. This ensures consistent autofill behaviour across platforms, enhancing utility and user reach of the extension.
Add support for complex form fields (dropdowns, checkboxes, Likert scales)	As a job seeker, I want dropdown fields to be recognized and filled correctly so that I don't have to select from lists manually	Dropdown fields are common in job forms for fields like location, job type, and availability. Automating this input streamlines applications and reduces manual errors.
	As a job seeker, I want checkboxes like "I accept terms and conditions" to be auto-checked so that I don't forget required options.	Checkbox inputs are often mandatory for submission. Auto-checking based on pattern recognition helps prevent user frustration and incomplete applications.
	As a user, I want Likert scale questions to be answered based on AI estimates so that I don't waste time filling subjective inputs.	Likert questions assess personality or soft skills. AI-generated answers save time and offer consistency across applications.
	As a user, I want to override auto-filled options in dropdowns and scales so that I retain control over my application.	Users need final say in what gets submitted. Editable autofill increases trust and accuracy.
Basic autofill function of extension	As a job seeker I want my personal details (name, contact, address) to autofill, so I don't need to type them every time.	Re-entering contact information is tedious and error prone. Autofill improves efficiency and ensures consistency.
	As a user, I want education and work history fields to be pre-filled so that I can apply faster.	Structured resume data can be reused across forms, reducing effort and supporting rapid bulk applications.
Implement logic for uploading resumes and cover letters	As a user, I want the extension to prompt me to choose a resume or cover letter when applying to a new job so that I can tailor documents.	Job-specific tailoring improves application success. Prompting ensures the correct document is attached.

(user-assisted if needed)	As a user, I want the extension to remember my default resume for each job platform so I don't need to re-select each time.	Saving defaults speeds up repeated use on known platforms.
	As a user I want to upload resumes/cover letters once and use them across applications so that it's more efficient.	Document reuse reduces redundant uploads, streamlining workflow.
Have function to delete CV if more than 10 on seek.	As a user, I want the extension to automatically delete the oldest CVs on Seek if I reach the 10-CV limit so that I can upload a new one.	Seek enforces a 10 CV limit. This automation ensures the user can continue submitting new applications.
	As a user, I want a notification before CV deletion so I can make an informed decision.	Notifying the user before deletion prevents accidental data loss and supports user control.
	As a user, I want to prioritize keeping the CVs most recently used in applications so that relevant documents are preserved.	Retaining recent and relevant files aligns with how users manage active applications.
Complete preview/logging functionality	As a user, I want the extension to keep a record of my past job applications so I can avoid duplicate submissions.	Logging helps track activity, avoid redundancy, and organize job search history.
	As a user I want each log to contain the platform name, job title, and submission date so I can easily refer to it.	Detailed logging supports follow-up, auditing, and preparation for interviews.
	As a user, I want to view application history filtered by platform or date so I can organize my job search.	Filtering logs improves usability and searchability when dealing with many applications.
	As a user, I want to preview all details including attached resume/Cover letter before submission, so I feel confident applying.	Ensures documents are accurate and appropriate for each submission, reducing risk of errors.
