

Script:

Proposed Demo Structure

Opening - 2 minutes

- Recap of project scope
- Key Stats?
- Outline problems addressed and achievements/features built in Sprint 1.

Transition to Sprint 2

- Briefly discuss client feedback on sprint 1
 - “Based on Kush's feedback....”
- Explain and list planned goals/achievements for sprint 2

Live Demonstration of Product - 8 minutes

- Show how a user can register on JobGenAi Test Website
- Reminder of the difference between Apply and Review
- Easy Apply/Review on LinkedIn - show resume is AI generated
- Change FAQ details on JobGenAI website
- Then, easy apply again but show how the autofill details have updated to be the same as the change in JobGenAI
- Show how extension keeps track of applied/saved jobs
- Move on to Normal apply demo
- Login
- Autofill
- Quickly show extension has kept track of the normal apply application
- Testing

Conclusion - 1 minute

- Recap on what problems have been addressed in this sprint + feature that solved it
 - Can include stats as well here
 - Plans for sprint 3
-

Intro - AQIL (3 mins)

Good Afternoon everyone. Today we're presenting our Sprint 2 progress on **AI Apply** - the Chrome extension that automates job applications using [JobGen.AI](#)'s artificial intelligence.

Before we begin, let's recap the aim of our project. The problem we're trying to solve is the endless cycle Job seekers are trapped in when they're trying to secure new employment.

Therefore our solution, AI Apply, is a Chrome extension that transforms this 30-minute process into a genuine one-click experience through integration with [JobGen.AI](#).

SPRINT 1 RECAP

In the first sprint, we established the foundation of our chrome extension:

- Firstly, we managed to implement basic auto-fill functionality for easy/quick apply jobs on LinkedIn where the application stays on the platform.
- We also integrated our extension with JobGen.AI's APIs for job FAQs such as employment history, resume and cover letter generation
- Ultimately, we built a one click experience on LinkedIn.
- One limitation was that the autofill was based on hard coded data rather than real user information.

SPRINT 2 BRIEF

Moving forwards to sprint 2, we set some goals we wanted to achieve based on feedback and discussions with our Client, Kush.

The goals include:

- Separate the "Apply" and "review" functionality
- Expand from Easy Apply only functionality to handling normal apply applications that require a user to complete a job application on another site.
- Implement job history tab within the extension for enhanced user experience
- Fully integrate with [JobGen.AI](#) where users can sign up, change their details, etc.
 - And any updates to the user's profile will be reflected immediately in new applications

LIVE DEMONSTRATION

Now, let's pass it onto Kathy to demonstrate the functionalities we have built during sprint 2 in alignment with the goals we have set.

Easy Apply & Live User Updates Demo - KATHY (1 min)

Thanks Aqil. So I'll be demonstrating the Easy Apply functionality in LinkedIn, which involves two buttons: the Review Button and Apply Button.

SHARE SCREEN

So this is our chrome extension as shown before but the key difference is that we now have a Review button. Previously, we implemented the detection and autofill of the form fields and now ->

When the user clicks on the Review button, the chrome extension would detect form fields and then autofills them and then automatically goes to the next button until we reach the review page. This functionality allows users to review their answers, mostly for those who do not fully trust AI to automatically submit their applications.

Now then on the same listing, we also have the apply button. When the user clicks on the Apply button, the chrome extension also detects and autofills form fields but instead of reviewing at the end, the chrome extension would automatically submit the application. This is for those that just want to complete a bunch of applications. So that's easy apply for linkedIn. Now onto Lachlan with user registration

User Registration & Setup - LACHLAN (2:30 mins)

[Navigate to https://www.jobgen.ai/version-test/ai_apply]

(slide 2) Every user journey begins here on the JobGen.AI platform. Let me show you the registration process.

(slide 3) First the user signs-up with their email and they get sent a link to verify the email.

(slide 4) Once complete, the user fills out general questions about their goals and motivations.

(slide 5) Then, we get into more specific questions about location, salary and job readiness. Dropdown fields with autocomplete assist users with the process.

(slide 6) Finally, users input their main challenges in finding a job.

(slide 7) Optionally users can add a resume which can be further tailored to their applications using AI.

(slide 8) We then reach the dashboard and have finished the registration process.

[Demo registration process, highlighting profile setup]

Once registered, users build their profile with work history, skills, and preferences. Now, our chrome extension automatically syncs with their JobGen.AI account - no separate login, no data re-entry. This seamless integration was a core Sprint 2 achievement. The only requirement from the user is that they have an existing account registered on [JobGen.AI](#) as we use their email and a Web Token to authenticate them.

Currently our phone number is the same in the JobGen website and the application form.

I'll now demonstrate how this works by changing my phone number in jobgen ai and we will see this change on the application form.

First I need to clear the cookies from the site as our extension caches the user profile data in the browser as requested by our client.

Change phone number and save in jobgenai. Then reload linkedin page and phone number changed to 000000000

The auto-filled information reflects my updated profile. This is another core functionality of sprint 2 that we didn't have in sprint 1.

Now I'll pass it to Lawrence to show the new job history tab

JWT/Progress Overview - LAWRENCE (2:30 mins)

[Show extension job history tab]

I'll now cover two core improvements we made in Sprint 2 based on direct stakeholder feedback. Both address stability and user experience: authentication and application history.

In Sprint 1, we used session cookies to authenticate users. This approach quickly became problematic – browser extensions require stateless, secure communication, and session cookies led to inconsistent behaviour and 400 errors.

To resolve this, we introduced a dedicated `jobgen_generate_token` endpoint that issues a JWT (JSON Web Token) valid for 24 hours. This token is now included in every API call. As a result, the authentication flow is now secure, stateless, and scalable – critical attributes for any production-grade browser extension.

[SHOW SCREEN]

In addition, we implemented a Job History tab inside the extension. This feature logs every job a user applies to or saves during a session. This was a common pain point raised by stakeholders – users wanted an easy way to track their past applications without relying on external systems or memory.

These upgrades – JWT-based authentication and the job history tracker – directly reflect stakeholder priorities and have laid the technical foundation for a smoother, more reliable, and scalable user experience moving into Sprint 3.

Normal Apply Demo - GOBIND (1 min)

The real challenge and Sprint 2's major breakthrough is handling normal applications as they can be complex multi-page forms that open in new tabs.

MORE HERE

Testing Sam: - SAM (1:30 min)

Initially in the sprint, the team struggled with the new and changing APIs' output and input to accommodate JWT security. I, along with the client, developed tests to confirm we're sending the right data and getting the right outputs. This helped us understand if the error was on our end or the api's, which enabled the rest of the team to build features safely.

Conclusion

And that brings us to the end of our sprint 2 demonstration. So far we are on track with our implementations where we have successfully implemented:

- Easy Apply in LinkedIn,
- Started working on Normal Apply in LinkedIn,
- Integrated the frontend with [JobGen.AI](#), and
- Added application history tracking.

For the next sprint, we plan to:

- Complete normal apply for LinkedIn by:
 - Redirecting users from LinkedIn to company websites
 - Figure out way to bypass user registration
 - Autofill their applications and submit

Thank you!
